

SRL Submission: What to Hand In (retired this edition, kept on file)

HONR 46400 · Evidence-Driven Research

⚠ Retired for the Fall 2026 edition: kept for a future one

The Student Research Lead role does not run this semester, so nothing in this document is required of you. Every Monday and Wednesday lecture from Week 2 now opens with a ten-minute **Lab Meeting** instead, and it is an **open round**: the instructor asks the room how the projects are going, and the room answers. What you decided since last time, what your evidence looks like, where somebody is stuck. **Nobody is assigned to report**, on any lecture. There is **no slot draw**: the assignment that once named your dates is withdrawn: **nothing is prepared** before class, by anyone, and **nothing said in the lab meeting is graded**. The instructor leads the lesson from minute 10 and owns accuracy, the AI tooling and the clock.

The 25% **Student Research Lead** grade category retired with the role. In its place, **Lecture Notebooks (20%)** collects the notebook you work in class, once a week. Everyone hands one in, and it is graded on completion alone.

Nothing below has been removed. This document is kept whole for a future edition that reinstates the role. Where a procedure would mislead you today, it carries a 🛑 **Retired procedure** note naming what happens instead. (*Rulings: [_project_docs/DECISIONS.md](#), D74 and D75, 2026-08-31. D75 withdrew the assigned reporter and the slot draw, and removed the injected 📌 **My Report Plan** cell from every notebook; the lecture's own cell is now simply ### 📌 **Lab Meeting**.*)

Read this before your first slot. It is the same for every one of your five leads, so nothing here changes from slot to slot except which lecture you are preparing.

What is collected this semester

Everything after this section is the retired SRL submission, kept for a future edition. This section is what is actually collected in Fall 2026.

Nobody submits a notebook the day before a lecture, and no submission belongs to one person's slot. Instead, you hand in **the week's lecture notebook**, the **nbNN** you worked in class, once a week, and so does everyone else:

- **Due 11:59 PM on the Sunday that ends that studio week.** Week 16 closes Friday Dec 11, the last class day.
- **Graded on completion only.** Worked through and handed in. Never on whether your answers came out right, and never on anything you did or did not say in a lab meeting.
- **Credit is 1.0** on time, 0.5 within seven days, 0 after that. Across the 16 weeks the lowest 2 credits drop automatically, so $\text{lecture notebook points} = 20.0 \times (\text{sum of your highest 14 credits}) / 14$.
- **How to hand it in** is unchanged in shape: open the notebook from the Schedule page, **File** → **Save a copy in Drive**, work it, then submit either a Colab share link set so that anyone with the link can comment, or the file itself (**File** → **Download** → **Download .ipynb**). Name it with your last name followed by the assignment's title.

This is the **Lecture Notebooks (20%)** category, one of the course's three completion contracts:

Category	Weight
Attendance	1%
Participation	9%
IYT Practice	15%
Lecture Notebooks	20%
Final Project	55%

Category	Weight
Total	100%

The dated list lives in [planning/LECTURE_NOTEBOOK_SCHEDULE.md](#), and your course platform carries the same dates. Where the platform and this repository disagree on a date, the platform is right.

The ten-minute **lab meeting** that opens each Monday and Wednesday lecture is separate, and it collects nothing at all. It is an open round: the instructor asks how the projects are going and the room answers. Nobody is assigned to it, nothing is prepared for it, and nothing said in it is graded.

What this assignment collects 🚫 (*retired procedure*)

The lecture notebook for the lecture you lead, filled in. Only the student holding this SRL slot submits here. If this lecture is not your slot, there is nothing for you to hand in and this assignment does not affect your grade. Open the notebook from the course Schedule page, then **File** → **Save a copy in Drive** so the copy is yours. Two things make it complete. First, fill the  **My Lead Plan** cell at the top of your lecture: how you will stage the puzzle, the one thing you are adding that the SRL Lead Brief does not have, your commitment question and how the room will record it, the decision you will close on with the defense question you will put to one person, and your fallback if the AI tool is slow or down. Second, work the rest of the notebook as a learner, so you have sat with every answer the room will reach before you ask anyone else to reach it.

What to hand in 🚫 (*retired procedure*)

One notebook. Either paste a Colab share link set so that anyone with the link can comment, which is the better option because it lets me write notes directly on the cells you will teach from, or upload the file itself (**File** → **Download** → **Download .ipynb**). Name it with your last name followed by this assignment's title, for example `LASTNAME_02_studio lec_01_srl.ipynb`. Submit by the deadline even if the notebook is rough. A rough plan I can send notes on beats a polished one that arrives after the review window has closed.

How it is graded 🚫 (*retired procedure*)

Your leading itself is scored on the nine rows of the SRL rubric, and the notebook you submit here feeds those rows before you walk in. A strong My Lead Plan shows up as strong Socratic questions, a real assumption probe, a specific AI plan, a workable timing plan, and a named connection to your classmates' projects. Nothing you write here is graded right or wrong.

The rubric your session is scored on 🚫 (*not applied this edition*)

🚫 **This rubric is not applied in Fall 2026.** Nobody leads or reports, and nothing said in the lab meeting is graded, so no live score is taken. All nine rows are reproduced below exactly as written, for a future edition that reinstates the role.

You are graded **live**, during your session, on the nine rows below. Each lead is scored on its own, and together those scores make up the SRL share of your course grade. The rubric measures one thing from nine angles: **did you run a Socratic investigation that kept the room thinking, used AI as an arm rather than a brain, and landed on a defended human decision?** It does not measure whether you knew every answer. Leading an investigation well while genuinely unsure can score Exemplary.

Criterion	Exemplary	Proficient	Developing	Beginning
1. Conceptual correctness (15)	The concept in play is handled correctly throughout; any student or AI error is caught	Concept is essentially correct; a minor imprecision, self-	A conceptual slip goes uncorrected until the instructor steps in; partial	A conceptual error spreads unchecked; the room leaves with a wrong idea (0–5)

Criterion	Exemplary	Proficient	Developing	Beginning
	and corrected; the room leaves with an accurate understanding (13–15)	corrected or harmless (10–12)	understanding leaves the room (6–9)	
2. Quality of Socratic questions (15)	Questions are open and non-leading and repeatedly hand the thinking back to the room; the room does the reasoning; the puzzle is staged in the lead's own way rather than read off the brief (13–15)	Mostly strong questions, with an occasional leading or yes/no question (10–12)	Questions often point at the answer or are answerable in a word; the lead does most of the reasoning (6–9)	Little real questioning; the session is a presentation, not an investigation (0–5)
3. Ability to expose assumptions (10)	Names the hidden assumption under at least one claim and makes the room examine it; the probe is the lesson (9–10)	Surfaces an assumption but does not fully work it (7–8)	Gestures at assumptions without naming one clearly (4–6)	Claims pass unexamined; no assumption surfaced (0–3)
4. Productive use of AI (15)	Commit-before-AI is enforced; AI is pointed at a specific job with a prepared prompt; the room sees AI used as an arm, not a brain (13–15)	AI is used purposefully, with a minor lapse such as a vague prompt or a skipped commitment (10–12)	AI is used loosely; the room reads an AI answer without committing first (6–9)	AI does the thinking, or “explain this topic” is read aloud, or the hard cap below triggers (0–5)
5. Ability to interrogate AI output (15)	Actively hunts the three failure patterns (fabrication, wrong method, missing uncertainty); sources are confirmed; AI overconfidence is called out (13–15)	Interrogates the AI but misses one failure pattern present in the output (10–12)	Light or superficial checking; takes the AI answer largely at face value (6–9)	AI output is accepted without interrogation (0–5)
6. Inclusion of classmates (10)	Every person in the room is drawn in and commits at least once; no one hides (9–10)	Most participate; one voice dominates or one person stays silent (7–8)	A couple of people carry the session; the rest stay passive (4–6)	The lead talks at the room; little participation (0–3)
7. Time management (5)	Hits the section checkpoints; each block gets its minutes; handoffs are clean (5)	A minor overrun, recovered (4)	Misses a checkpoint by a wide margin; a block gets squeezed (2–3)	Runs out of time; sections are dropped (0–1)
8. Connection to research decisions (10)	Explicitly ties the skill to the room's own projects and the current milestone; a real project decision is named (9–10)	Connects to projects in general terms (7–8)	A token connection tacked on at the end (4–6)	No connection to anyone's research (0–3)
9. Handling of incorrect or uncertain answers (5)	Wrong answers are examined as data; no one is humiliated; the lead's own uncertainty becomes an investigation (5)	Wrong answers handled respectfully but moved past quickly (4)	A wrong answer is shut down, or a person is left uncomfortable (2–3)	A classmate is humiliated, or the lead hides from uncertainty by faking an answer (0–1)

Total: 100 points (15 + 15 + 10 + 15 + 15 + 10 + 5 + 10 + 5 = 100).

The hard cap

Presenting an AI answer as settled without verifying it caps row 4 (Productive use of AI) at Beginning (0–5), regardless of the rest of that row.

This is the course’s central discipline with teeth. AI may propose; the researcher must verify. If you let an AI answer stand as the final word in front of the room, without the class confirming sources, cross-checking facts, or committing to a human decision, you have modeled the exact behavior the course exists to prevent, and row 4 cannot exceed Beginning. The fix is simple and lives in every session: run the “After running, verify” checklist out loud, then close on a decision the room defends.

The rubric above is reproduced from [srl_rubric.md](#), which is the canonical version and carries the fuller explanation of how the score comes together. Related: [srl_handbook.md](#) (the role these rows measure), [srl_ai_integration_guide.md](#) (rows 4 and 5 in depth), [socratic_question_bank.md](#) (questions to reach for when you get stuck).
